

ZedTac

Website Architecture Map

A plain-English guide to how the site is built,
explained one section at a time.

What is in this document

Part	Covers
Start here	How to read this
Part 1	What the website is
Part 2	The twelve pages, one by one
Part 3	What appears on every page
Part 4	What the website can do
Part 5	What is inside it, counted
Part 6	How the pages work behind the scenes
Part 7	Screens and accessibility
Part 8	How a change goes live
Part 9	Still to do

This document lists what has been built into the ZedTac website. It is written for someone who is not a developer - every technical word is explained the first time it appears.

How to read this document

Two things explain most of how the site behaves:

- **The whole website is one file.** Not one file per page - one single file, `ZedTac-Website.html`. It holds all twelve pages and everything they do.
- **Pages do not reload.** Clicking 'Pricing' does not fetch anything from the server. The file is already loaded, so the site just swaps what is shown. That is why it feels instant.

Words you will meet

Word	What it means here
Page / route	One page of the site, for example <code>/pricing</code> .
Section	One band of content inside a page.
Card	A small box holding one item - a service, a case study, a plan.
Carousel	A row of cards that scrolls sideways.
Dropdown	A panel that opens under a menu link.
Vue	A small free library that swaps the visible page without reloading.

What the website is

Twelve pages, all delivered from one file. There is no database and no separate backend - the site is self-contained.

All twelve pages live inside the one file. The browser downloads it once.

What	How much
Pages	12
Sections across all pages	About 45
Interactive features	14 (listed in Part 4)
Drawings built into the page	121
Content items (services, modules, case studies and so on)	Over 150

The twelve pages, one by one

What each page holds, in the order a visitor meets it.

Home /

- Opening statement - 'Run your entire operation then let it run itself', with a live product panel beside it
- Three layers, one ledger - how the platform is stacked
- ERP keeps the record. Automation takes the action - how the two halves meet
- Depth where it matters - industry cards that scroll on their own
- Eight sectors running on the same platform
- ERP deployments and the results they delivered - 8 case studies
- Notes on enterprise systems that actually get adopted - 6 articles

About /about

- Opening statement and short introduction
- A wide illustration: one ledger with six operations posting into it
- Our story - the company, how the work starts, and what happens after go-live
- Four figures: 12+ years, 120+ implementations, 98% retention, 8 industries
- A closing line and a Book a consultation button

ERP Services /erpsservices

- Opening statement - 'One governed system of record for the whole operation'
- What the ERP core covers - 5 capability groups
- End-to-end ERP delivery - all 14 services, six shown until See All is clicked
- Depth where it matters - how verticals sit on the shared engine
- A band pointing across to Automation Services

Features /features

- Everything the platform does - 9 feature groups in one place

Integrations /integrations

- Connected to the systems you already run
- 13 integrations, sorted into 4 groups

Documentation /docs

- How the platform works, written down
- 6 reference documents
- The event catalogue - what the automation engine can react to

FAQs /faq

- 28 questions in 3 groups. Clicking a question opens its answer.

Automation /automation

- Opening statement - 'Your ERP holds the data. Automation makes it act'
- A system of record, and a system of action
- Events, rules, actions - and a record of every run
- Eleven modules, one event engine - six shown until See all is clicked
- Automation runs on the same ledger your ERP writes

One automation module /module/n

- A detail page for a single module, opened from the Automation page
- The number in the address says which of the eleven is shown

Outcomes /outcomes

- The numbers that moved after go-live - 4 headline figures
- Three places an ERP pays for itself
- What actually changes, measure by measure
- What operations leaders say - 6 client reviews
- Outcomes across eight sectors
- Why these numbers are defensible

Pricing /pricing

- Opening statement - 'ERP pricing that starts with your process, not a license count'
- 3 packages, one marked Most Popular
- Every feature, side by side - the comparison table
- 6 things included on every engagement
- 6 add-ons that can be added after go-live

The ERP Platform /erp

- Opening statement - 'One ERP platform to run your entire operation'
- A working dashboard mock-up: sidebar, live figures, chart, stock, purchase orders and approvals
- Everything your operation needs, in one governed system

What appears on every page

Six pieces sit outside the pages. They are built once and stay on screen whichever page you are on.

1. Loading screen

- Shows the animated ZedTac mark while the page gets ready, then hides itself.
- It exists so a visitor never sees a half-drawn page.

2. The top bar

- A floating bar holding the ZedTac wordmark, the menu, and the Customer Portal button.
- Stays visible while you scroll, and sits above everything else on the page.

3. Menu and dropdowns

- Five items: Services, Pricing, Resources, About, and the Portal button.
- Services and Resources open a panel below the bar when hovered.
- An invisible strip bridges the gap between the link and the panel, so the menu does not close while the mouse travels down to it.

4. Mobile menu

- On tablets and phones the links collapse behind a burger button.
- Opening it slides in a full panel; the burger turns into a close X.

5. Footer

- The large wordmark, a newsletter sign-up, and six columns of links.
- Product, Company, Download, Connect, Legal and Contact Us.
- Contact Us holds the email address and phone number - both open the mail app and dialler on a phone.
- Connect holds the LinkedIn, Instagram, Facebook and WhatsApp links.

6. Cookie banner and chat assistant

- The cookie banner sits at the bottom until the visitor accepts or declines.
- The chat launcher reads 'Chat with us' and opens the assistant.
- The assistant can also take the visitor to a page of the site.

What the website can do

Fourteen things on the site respond to the visitor rather than just sitting there.

Feature	What it does	Where
Page switching	Moves between pages with no reload or waiting	Everywhere
Dropdown menus	Open a panel under Services and Resources	Top bar
Mobile menu	Collapses the menu behind a burger button	Tablet and phone
Self-scrolling carousels	Rows of cards that move on their own, and can be dragged	Home
Case-study slider	Eight deployments that scroll sideways, with arrows	Home
Scroll reveal	Sections fade in as they come into view	Everywhere
Show more	Six items shown, the rest revealed on click	Services, Automation
Module pages	Each of the eleven modules opens its own page	Automation
FAQ accordion	Clicking a question opens its answer	FAQs
Comparison table	Every feature across the three packages	Pricing
Live dashboard mock-up	A working ERP screen with figures, chart and panels	ERP Platform
Newsletter sign-up	Collects an email address, with success and error states	Footer
Cookie consent	Accept or decline, remembered for the visitor	Everywhere
Chat assistant	Answers questions and can move the visitor to a page	Everywhere

What is inside it, counted

All of this text is written in one place and reused by the pages. Changing an item changes it everywhere it appears.

Item	How many
Services and delivery	
ERP services	14
Delivery phases	6
Capability groups in the ERP core	5
Feature groups	9
Automation	
Automation modules, each with its own page	11
Steps in the event engine	4
Rollout phases	5
Proof and content	
Case studies	8
Client reviews	6
Articles	6
Headline outcome figures	4
Industries covered	10
Commercial and reference	
Pricing packages	3
Things included on every engagement	6
Add-ons available after go-live	6
Integrations	13
Reference documents	6
FAQ questions	28

How the pages work behind the scenes

There is no page-to-page loading. One value in memory decides what is on screen.

What happens	Behind the scenes
You click a menu link	One value changes, for example to 'pricing'.
The screen changes	The old page is hidden and the new one shown, instantly.
The address updates	Rewritten to /pricing so the link can be copied and shared.
Back button	Restores the previous page, so history behaves normally.
Someone opens /pricing directly	The server hands over the same file; the site reads the address.

Why every link can be shared

The server is told: whatever address is asked for, send the one file. Real files such as images are still served normally. Without this, opening /pricing directly would return 'page not found', because no file of that name exists.

Screens and accessibility

The site was built to work on every screen, and to stay usable for visitors who need help reading it.

Screens

There are 186 separate size rules. The layout is rearranged at each size, not simply shrunk.

Screen	What changes
Large desktop	Content is capped in width so lines never get too long to read.
Laptop	Grids drop from four or five columns to two or three.
Tablet	The menu collapses into the burger. Side-by-side layouts stack.
Phone	One column. Buttons go full width. Decorative pieces are hidden rather than squashed.

Accessibility

- **Reduced motion.** 45 rules switch animation off for visitors whose device asks for less movement.
- **Screen readers.** 80 labelling attributes describe buttons, menus and decorative images.
- **Keyboard.** Menus, cards and the FAQ can be reached and opened without a mouse.
- **Readability.** Every piece of text was checked against the background behind it, on every page, and passes the AA standard.
- **Touch.** Tap targets have a minimum size, so buttons are not too small on a phone.

How a change goes live

One rule, and it is the only one: **pushing to the main branch publishes the site**. Nothing else does.

Step	What happens
1	The file is edited and saved.
2	The change is committed and pushed to the main branch on GitHub.
3	Netlify notices the push.
4	Netlify publishes the repository exactly as it is. There is no build step.
5	The site is live, usually within about a minute.

Two things worth knowing

- **The live site is always exactly what is on main.** There is no separate upload, and nothing can go live that is not saved.
- **zedtac.com is not connected yet.** It still shows the domain provider's holding page. The real site is on the netlify.app address until the domain is pointed across.

If a change does not appear

Almost always the browser is showing a saved copy. Because the whole site is one file, a saved copy shows the entire old version. A hard refresh fixes it.

Still to do

Recorded so they are not mistaken for faults.

Item	Detail
Image files	The 23 drawings in the images folder have not been updated to match the current look. They are picture files, so they were not covered by the site-wide work.
WhatsApp link	Still points at a Pakistan number, while the phone number beside it in the footer is the +1 company number.
LinkedIn link	Points at a personal profile rather than a company page. The other social links point at company accounts.
The domain	zedtac.com still serves a holding page and is not yet pointed at the live site.
App Store links	The Download column is marked Coming Soon.

End of document.
